In CAD systems, the design process is often a work area which has a design view and a data display view. The former shows the design as a two-dimensional (2D) sketch. The latter displays the design information including 3D objects, parameters, files and windows. Data display views are generally available in three forms. 3D is a software product, licensed per CAD model, which displays 3D objects on the design view. In addition, some CAD software supports product engineering by displaying engineering quantities. Tools such as design tools, draftsman tools and electronic sheets enable users to perform various drafting tasks. The most common design tools, such as swatches, property editors, ofsetting, and text editing tools, are available in most software packages. Draftsman tools allow the creation of 3D objects such as 2D drawings, solid models and surfaces. Some CAD programs also provide tools for digital dimensioning (reducing 2D dimensions to actual 3D lengths). The most common tool for digital dimensioning is the TEC dimensioning feature. Software that supports parametric or schematic-based design work allows the user to create two- and three-dimensional parametric or schematic models, which are models whose parts can be restaped and sized to meet design specifications. CAD software includes a variety of tools for this purpose. Project management In the c6c30c18c
